The final cDNA was cloned in pAMP1 vector in annealing reaction with Uracil DNA Glycosylase (UDG). Library constructed by Y.Korshunova and M. Lovett. Library materials provided by Mills UC & Gordon JI.

Seq primer: -40RP from Glbco
High quality sequence stop: 585.

Nishi Y; Aoki Y, Sha S,

WPI; 2001-024452/03. N-PSDB; AAC61149. Gene encoding an antigen recognizing an antibody which induces granulocyte colony stimulating factor (G-CSF) expression for gene therapy and treatment of G-CSF associated disorders e.g. the side effects of cancer therapy.

Claim 2; Page 49-50; 58pp; Japanese.

The present invention relates to a gene encoding an antigenic protein recognised by an antibody or its fragments which can induce the production of granulocyte colony stimulating factor (G-CSF). Also included in the invention are partial sequences of the gene, antibodies recognising all or part of the antigenic protein, expression vectors containing the gene and host cells transformed by the vector. The gene is used for gene therapy, and compounds identified by screening using the gene sequence are used for treatment and prevention of disorders therapy (including bone marrow suppression). The present sequence represents the murine antigen of the invention

```

The invention relates to a mouse or human gene (MMR19) encoding a protein which binds to antibodies or their fragments which induce granulocytecolony stimulating factor (G-CSF) secretion. The genes and proteins of the invention are used in diagnosis, treatment and prevention of diseases associated with G-CSF, including infections and neutrophil deficiency disease. This sequence represents a mouse G-CSF-inducible antibody binding protein, MMR19

The invention describes a cartilage cell differentiation stimulator (containing a membrane-bound transferrin-like protein (WTf-BP) and a membrane bound type transferrin-like protein (WTf) and an animal-derived concanavalin-like drug. The cartilage differentiation stimulator can be used in diagnosis, prevention and treatment of cartilage and bone metabolism diseases. They can also be used for diagnosing biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. MTf-BP strongly stimulates differentiation of cartilage cells and exhibits similar action mechanism with that of plant

The present sequence represents a human enzyme. The enzyme polynucleotide and polypeptide are useful for diagnosis, treatment and prevention of cancers, neurological disorders (e.g. epilepsy, stroke, Alzheimer's disease, heurington's disease, dementia, multiple calsease, pick's disease, amyotropic lateral sclerosis, bacterial sclerosis, parkinson's disease, amyotropic lateral sclerosis, bacterial and viral meningitis, schizophrenic disorders and neuroskeletal disorders), autoimmune/inflammatory disorders (e.g. allergies, addison's disease, autoimmune diseases, adult respiratory distress syndrome, anemia, asthma, Crohn's disease, atopic dermatitis, diabetes mellitus, corecoporosis, pancreatitis, psoriasis, rheumatorid arthritis, and viral, botterial, fungal, parasitic, protozoal and helminthic infections), cancertic disorder (e.g. Duchenne and Becker muscular dystrophy, Gaucher's disease, Huntington's chorea, sickle cell anemia, thalassemia, Von Willebrand's disease and Wilms' tumour), and cell proliferative disorder attainsoclerosis, leukemia, hepatitis, cirrhosis, and attaining or attaining or attaining or also asserted also also asserted or attaining or and wilms' tumour), and cell proliferative disorder attaining coresis, leukemia, hepatitis, cirrhosis, and attaining or attaining or attaining or also asserted also also asserted and wilms' tumour).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           119

The invention describes a cartilage cell differentiation stimulator (containing a membrane-bound transferrin-like protein (WTF-BP) and a membrane bound trype transferrin-like protein (WTF) and an animal-derived concanavalin-like drug. The cartilage differentiation stimulator can be used in diagnosis, prevention and treatment of cartilage and bone metabolism diseases. They can also be used for diagnosing biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. MTF-BF strongly stimulates differentiation of cartilage cells and exhibits similar action mechanism with that of plant derived ConA. This is the animo acid sequence of a cartilage cell differentiation stimulator associated polypeptide described in the A cartilage cell differentiation stimulator useful in the diagnosis of biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. New HFIZG53 polypeptide and polynucleotide - useful as diagnostic reagents and for prevention and treatment of inflammatory diseases, cancer and Parkinson's disease.

WPI; 1999-083567/08 N-PSDB; AAX05748. Claim 11; Page 7; 22pp; English.

This represents the amino acid sequence of human HFIZG53 Host cells containing an expression system comprising the HFIZG53 nucleic acid are used for the recombinant production of the protein. HFIZG53 polypeptides can depolymenteleotides are useful for diagnosing diseases related to over or underexpression of HFIZG53 protein. The HFIZG53 polypeptides can be used to extivate or inhibit HFIZG53 activity. Gene therapy may also be used to affect endogenous polypeptide production, using HFIZG53 polymeleotides and retroviral vectors. HFIZG53 activity. Gene therapy may also be used to affect endogenous polypeptide production, using HFIZG53 polymeleotides and retroviral vectors. HFIZG53 antibodies are useful for inducing an immune response to immunise and prevent diseases, and for isolating the HFIZG53 clones or purifying the polypeptide by affinity chromatography. HFIZG53 clones or purifying the polypeptide by affinity chromatography. HFIZG53 polypeptides can be administered directly or as a vaccine to inculude inflammatory diseases prevented, diagnosed or treated include inflammatory diseases prevented, diagnosed or treated cinclude inflammatory diseases prevented, diagnosed or treated concornant or the unation and viral, particularly HIV-1 and -2; HIV-associated cachexia and other immunodeficiency disorders; septic shock; injury; pain; cancers including testicular cancer; anorexia; bulimia; Parkinson's adsesse; cardiovascular disease including restenosis, atherosclerosis, acute heart fallure, myocardial infarction, hypotension, hypertension, urinary retention; angina pectoris; ulcers; benign prostatic hypertension, urinary cetention; angina pectoris; ulcers; benign prostatic hypertension, urinary retention; angina pectoris; ulcers; benign prostation) and dyskinesiae, such as Huntington's diseases or Gilles de la Tourette's syndrome. The HFIZG53 polypeptide is also useful for mapping the gene to a chromosome,

Also inteluded in the invention are partial sequences of the gene, antibodies recognising all or part of the antigenic protein, expression vectors containing the gene and host cells transformed by the vector. The gene is used for gene therapy, and compounds identified by screening using the

```

AAY85636

```
The invention relates to a mouse or human gene (MMR19) encoding a protein which binds to antibodies or their fragments which induce granulocytecolony stimulating factor (G-CSF) secretion. The genes and proteins of the invention are used in diagnosis, treatment and prevention of diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            191
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymocleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities,
                                                                                                                                                                                                                                                                                                                                                                       80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABBS77072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             81 DISGPPASKKLKKSQCTPLFMNAYTMRGAGAVIHTHSKAAVMATLLFPGQEFKITHQEMI

Rosen CA;

WPI; 2001-235357/24. N-PSDB; AAH33805 Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers. Claim 11; Page 6841; 9803pp; English

example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids tinto a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. Zyskind JW; Xu HH; Haselbeck R, Ohlsen KL, Yamamoto R, Forsyth RA, Malone C, Carr GJ, Zamudio C, Trawick JD, 2003-029926/02 N-PSDB; ACA21321 Ď, Wang Wall

Claim 25, SEQ ID NO 45375; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

CC of the nucleic acid inhibits proliferation of a cell. Also included are:

CC of the nucleic acid inhibits proliferation is inhibited by the antisense canceling a polypeptide expression is inhibited by the antisense conclain a polypeptide whose expression is inhibited by the antisense controlled antisense actisense acid; (2) a host cell containing the vector; (3) an isolated continued antisense actisense nucleic acid; (4) an antibody capable of specifically binding contiferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway crequired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation; (8) identifying a gene required for cellular proliferation; (8) identifying a gene required for cellular proliferation; (9) manufacturing an antibiotic; (10) profilling a

The invention relates to an isolated nucleic acid compilering any one of the mucleic acid inhibite proliferation of a cell. Also included are:

Co the nucleic acid inhibite proliferation of a cell. Also included are:

Co the nucleic acid inhibite proliferation of a cell. Also included are:

Co (1) a vector comprising a promoter operably linked to the mucleic acid

mucleic acid; (2) a host cell containing the vector; (3) an isolated

conclain a polypeptide whose expression is inhibited by the

mucleic acid; (3) a host cell containing the vector; (3) an isolated

antisense nucleic acid; (4) an antibody capable of specifically binding

conclieration or the activity of a gene in an operon required for

proliferation or that has an activity against a biological pathway

co proliferation or that has an activity against a biological pathway

co proliferation or that has an activity against a biological pathway

co required for proliferation required gene or its gene product lies

compound's agene on which the test compound that inhibits proliferation of an

compound's activity; (1) a culture comprising strains in which the gene

compound's activity; (1) a culture comprising strains in which the gene

compound's activity; (1) a culture comprising strains in which the gene

compound's activity; (1) a culture comprising strains in which the strain

compound's activity; (1) a culture comprising strains in which the gene

compound's activity; (1) a culture comprising strains in which the gene

compound's activity; (1) a culture comprising strains in which the gene

compound's activity; (1) a culture comprising strains in which the gene

compound's activity; (1) a culture comprising strains in which the strains is present in a culture or collection of

confideration of an organism. The attended are useful for

confideration of an organism. The attended acids required

confideration of an organism. The arcenting for homologous nucleic acids are useful

The invention relates to an isolated nuclear acts compliantly any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

Co of the nucleic acid inhibits proliferation of a cell. Also included are:

Co concoding a polypeptide whose expression is inhibited by the antisense continued a card continued whose expression is inhibited by the antisense continued at a host cell containing the vector; (3) an isolated continued or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the continued or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that has an activity against a biological pathway to require for proliferation or the biological dentifying a gene required for cellular proliferation of the biological corresponds against a proliferation of the biological corresponds acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits the extent or or agene on which the test compound that inhibits the product is overexpressed or underexpressed; (12) determining the extent or which each of the strains is present in a culture or collection of the strains; or (13) identifying the target of a compound that inhibits the compounds; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for for cellular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                   The invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.

```

```
drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                      88888888%

Patent No. 6583275
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Lynn A Doucette-Stamm and David Bush
APPLICANT: Lynn A Doucette-Stamm and David Bush
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
FITLE OF INVENTION: ENTEROCOCCUS FAECIUM FOR DIAGNOSTICS AND THERAPEUTICS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LDNHIIEG-----KLNPSSDTPTHAVLYRSFPQIGGIVHTHSTWAQAGLDVPAMGT 116

-i- FUNCTION: PROBABLE PENTULOSE-5-PHOSPHATE-4-EPIMERASE. PROBABLY

-i- FUNCTION: A METABOLLC PATHWAY WITH SGAH AND SGAU.

-i- COFACTOR: Binds 1 zinc ion per molecule (Potential).

-i- SIMILARITY: Belongs to the aldolase class II family. AraD/fucA

-!- COFACTOR: Binds 1 zinc ion per molecule (Potential).
-!- PATHWAY: L-arabinose catabolism; third step.
-!- INDUCTION: Transcription is repressed by glucose and by the binding of arak to the operon promoter. L-arabinose acts as an inducer by inhibiting the binding of arak to the DNA, thus allowing expression of the gene.
-!- SIMILARITY: Belongs to the aldolase class II family. AraD/fucA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-FEB-2003 (Rel. 41, Created)

PROBABLY INVOLVED IN A METABOLIC PATHWAY WITH SGAH AND SGAU.
COFACTOR: Binds 1 zinc ion per molecule (Potential).
SIMILARITY: Belongs to the aldolase class II family. AraD/fucA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bacteria; Proteobacteria; Gammaproteobacteria; Enterobacteriales;

"Structures of L-fuculose-1-phosphate aldolase mutants outlining
motions during catalysis.";
J. Mol. Biol. 303:531-543(2000).
-!- CATALYTIC ACTIVITY: L-fuculose 1-phosphate = glycerone phosphate
(S)-lactaldehyde.
                                                                                                                                                -!- COFACTOR: Binds 1 zinc ion per molecule.
-!- PATHWAY: Fucose metabolism; third step.
-!- SUBNIATT: HOmotetramer.
-!- SUBNIARITY: Belongs to the aldolase class II family. AraD/fucA subfamily.
